Data Management Plan for Research Students

1. Overview

Researcher: Groupwork
Project title: Predictive factors that are linked with student dropout or completion
Project duration:2 Months
Project context: Student retention in higher education is the topic under the discipline of education.

2. Defining your data/research sources

2.1 Where will your data/research sources come from? The information will be gathered from many sources, such as student records, surveys, and institutional data. Interviews with academics, staff, and students will also be done.
2.2 How often will you get new data? The availability of resources and data will determine how frequently data is collected.

This template is licensed under a Creative Commons Attribution 3.0 Unported License.

2.3 How much data/information will you generate? We have already gathered several hundred MB of data, and we anticipate that this will increase as more data is gathered.
2.4 What file formats will you use? We will use a CSV file format for student records. We will use excel, R Studio to work on the data

3. Organising your data

3.1How will you structure and name your folders and files? By data type (such as student records) and period, we will categorize our data into folders. We'll also use illustrative file names to make it simpler to grasp what each file contains.
3.2 What additional information is required to understand each data file? For the advantage of the reader, the following definitions are provided. .Reproducing the data's results will depend on this
3.3 What different versions of each data file or source will your create? As we clean and preprocess the data, we will make numerous copies of each data file. We can differentiate between multiple versions by utilizing file names that include the version number.

4. Looking after your data

4.1 Where will you store your data?

We will store the data on our laptops

4.2 How will your data be backed up?

Several copies of our data will be kept by us in various places.
In order to keep them current, we will regularly update our backups.

4.3 How will you test whether you can restore from your backups?

By recovering a sample of our data and confirming that it is accurate and complete, we will periodically test our backups.

5. Sharing your data

5.1 Who owns the data you generate?

Group members will be the owner of the data.

5.2 Who else has a right to see or use this data?

Only members of our study team and authorized staff at our institution will have access to the data.

5.3 Who else should reasonably have access to this data when you share it?

We'll make our data available to other research doing similar work in case they're interested in revisiting or building on our findings. Also, we will make the data available to our institution for internal use.

This template is licensed under a Creative Commons Attribution 3.0 Unported License.

5.4 What should/shouldn't be shared and why? Information on this dataset is public and opensource. It is safe to share with everyone

6. Archiving your data

6.1 What should be archived beyond the end of your project? There will be an archive of all data files, data dictionaries, and analysis scripts.
6.2 For how long should it be stored? In compliance with EPSRC recommendations, data will be kept for at least 10 years beyond the date of last access.
6.3 When will files be moved into the data archive/repository? At the conclusion of the project, files will be transferred into the archive.
6.4 Where will the data be stored? A disciplinary repository or an institutional repository will house the data.
6.5 Who is responsible for moving data to the data archive and maintaining it?

This template is licensed under a Creative Commons Attribution 3.0 Unported License.

The group members are in charge of maintaining and moving the data to the archive.
6.6 Who should have access and under what conditions? That's because the information can be obtained to all, accessibility is not limited to any particular group of people. Users must, however, follow by the terms and conditions of the dataset source, which may place limitations on how the data may be used or demand attribution.

7. Executing your plan

7.1Who is responsible for making sure this plan is followed? With supervision from higher-level management, the group members typically shoulder this role.
7.2 How often will this plan be reviewed and updated? The plan should be assessed and revised in the instance that the project's requirements or scope significantly change. The group members should decide how often the work is reviewed.
7.3 What actions have you identified from the rest of this plan? 1.For the first month of the project, make an inventory of the available data and assess the data fields. 2.Within the first two months of the project, conduct an analysis of the data to find any possible correlations between the factors that might be utilized to forecast student retention. 3.Within the first two months of the project, employ data visualization approaches to help stakeholders comprehend the links between the variables and share the results. 4.In the first two months of the project, validate the model's effectiveness using the proper statistical measures. 5.Within the first two months of the project, create a report outlining the findings and presenting the outcomes to stakeholders.

This template is licensed under a Creative Commons Attribution 3.0 Unported License.

7.4 What further information do you need to carry out these actions?

Explanations that go into great detail about each variable in the dataset, including their definitions, units of measurement, and any coding systems that were applied. You may get this information in the dataset documentation, which ought to come with the dataset itself. Details on the methods used for data sampling, the steps taken to clean the data, and any restrictions on the data. Furthermore, you can find this information on the website or platform where the dataset was made accessible, in the dataset documentation, or both. More context concerning the higher education system or setting that the dataset relates to would be helpful in conceptualizing the results and enhancing their understanding.

Notes on completing this form

- Type as much (or as little) as you feel you need to into each box: it will expand to accommodate what you write;
- You can leave or remove the prompts in grey once you're done;
- For help with completing this DMP, please contact researchdata@brunel.ac.uk
